

BURHAN

Proof That Protects You

An AI-Powered Legal Document Analysis and Citizen Legal Empowerment Platform

Abstract

Millions of Pakistanis sign legally binding documents — rental agreements, employment contracts, tenancy papers, sale deeds, and marriage documents — that they cannot read, cannot parse, or have not fully reviewed before signing. Drafted in dense legal English or formal Urdu and often lengthy enough to discourage complete reading, these documents disproportionately disadvantage farmers, daily-wage workers, domestic staff, tenants, and women navigating family law matters, who sign largely on trust. This project proposes Burhan, an AI-driven mobile and web platform that ingests a photographed or uploaded legal document and returns a clause-level risk assessment benchmarked against Pakistani statutory law, delivered in plain Urdu or English with full traceability to the supporting legislation or judgment.

Text is extracted via a multi-script OCR pipeline tolerant of degraded real-world captures — poor lighting, skew, low resolution — and segmented into discrete clauses for analysis. Each clause is evaluated through a retrieval-augmented pipeline indexed on the Pakistan Laws Dataset and Supreme Court judgment corpora, identifying unenforceable terms, internal contradictions, and missing statutory protections, with findings assigned graded risk levels rather than binary verdicts. The same engine validates informal Jirga and panchayat rulings against codified entitlements.

Beyond diagnosis, the platform generates actionable guidance: applicable dispute forums, comparable case precedent, and a lawfully rewritten version of the document with unfair clauses corrected, produced via a legal domain-adapted language model. Confidence is modeled explicitly, and low-confidence findings are routed to licensed practitioners — positioning Burhan as a triage and information layer rather than a substitute for legal counsel.
