

Your capabilities

July 19, 2026

Based on the provided documents, here is a generated PDF report about the capabilities of the AID project:

AID Project Capabilities Report

Introduction The AID project aims to develop an AI system that can screen for early autism risk, classify risk, and generate an automated report based on a set of structured behavioral data and learning algorithms.

Key Features

- 1 **Early Autism Risk Screening:** The system can detect early signs of autism risk in individuals using standardized screening questionnaires such as Q-CHAT.
- 2 **Automated Report Generation:** The system generates a comprehensive report based on prediction scores and natural language explanations, providing combined information to support user interpretations.
- 3 **Robust and Scalable:** The system is designed to be robust to any inputs and scalable to any volume and scale, using real and synthetic data for training and testing.
- 4 **User-Friendly Reports:** The system provides easily understandable reports and optional reports to help users interpret the results without requiring technical expertise.

Technical Capabilities

- 1 **FastAPI and Uvicorn:** The system utilizes FastAPI and Uvicorn for endpoint routing, schema validation, and async request handling.
- 2 **Pydantic:** The system uses Pydantic for schema validation and data modeling.
- 3 **LLM and Groq SDK:** The system leverages LLM (Large Language Model) and Groq SDK for advanced language processing and narrative generation.
- 4 **Llama-3.1 8B:** The system is powered by the Llama-3.1 8B model, a state-of-the-art language model for generating human-like text.

Conclusion The AID project has developed a robust and scalable AI system for early autism risk screening and automated report generation. With its advanced technical capabilities and user-friendly reports, the system has the potential to alleviate work for healthcare professionals and provide valuable insights for individuals and families affected by autism.
